# Implantable BCIs for Restoring Communication

---

Frank Willett

Assistant Professor

Department of Neurosurgery

Co-Director of the Neural Prosthetics Translational Laboratory

# The Clinical Need

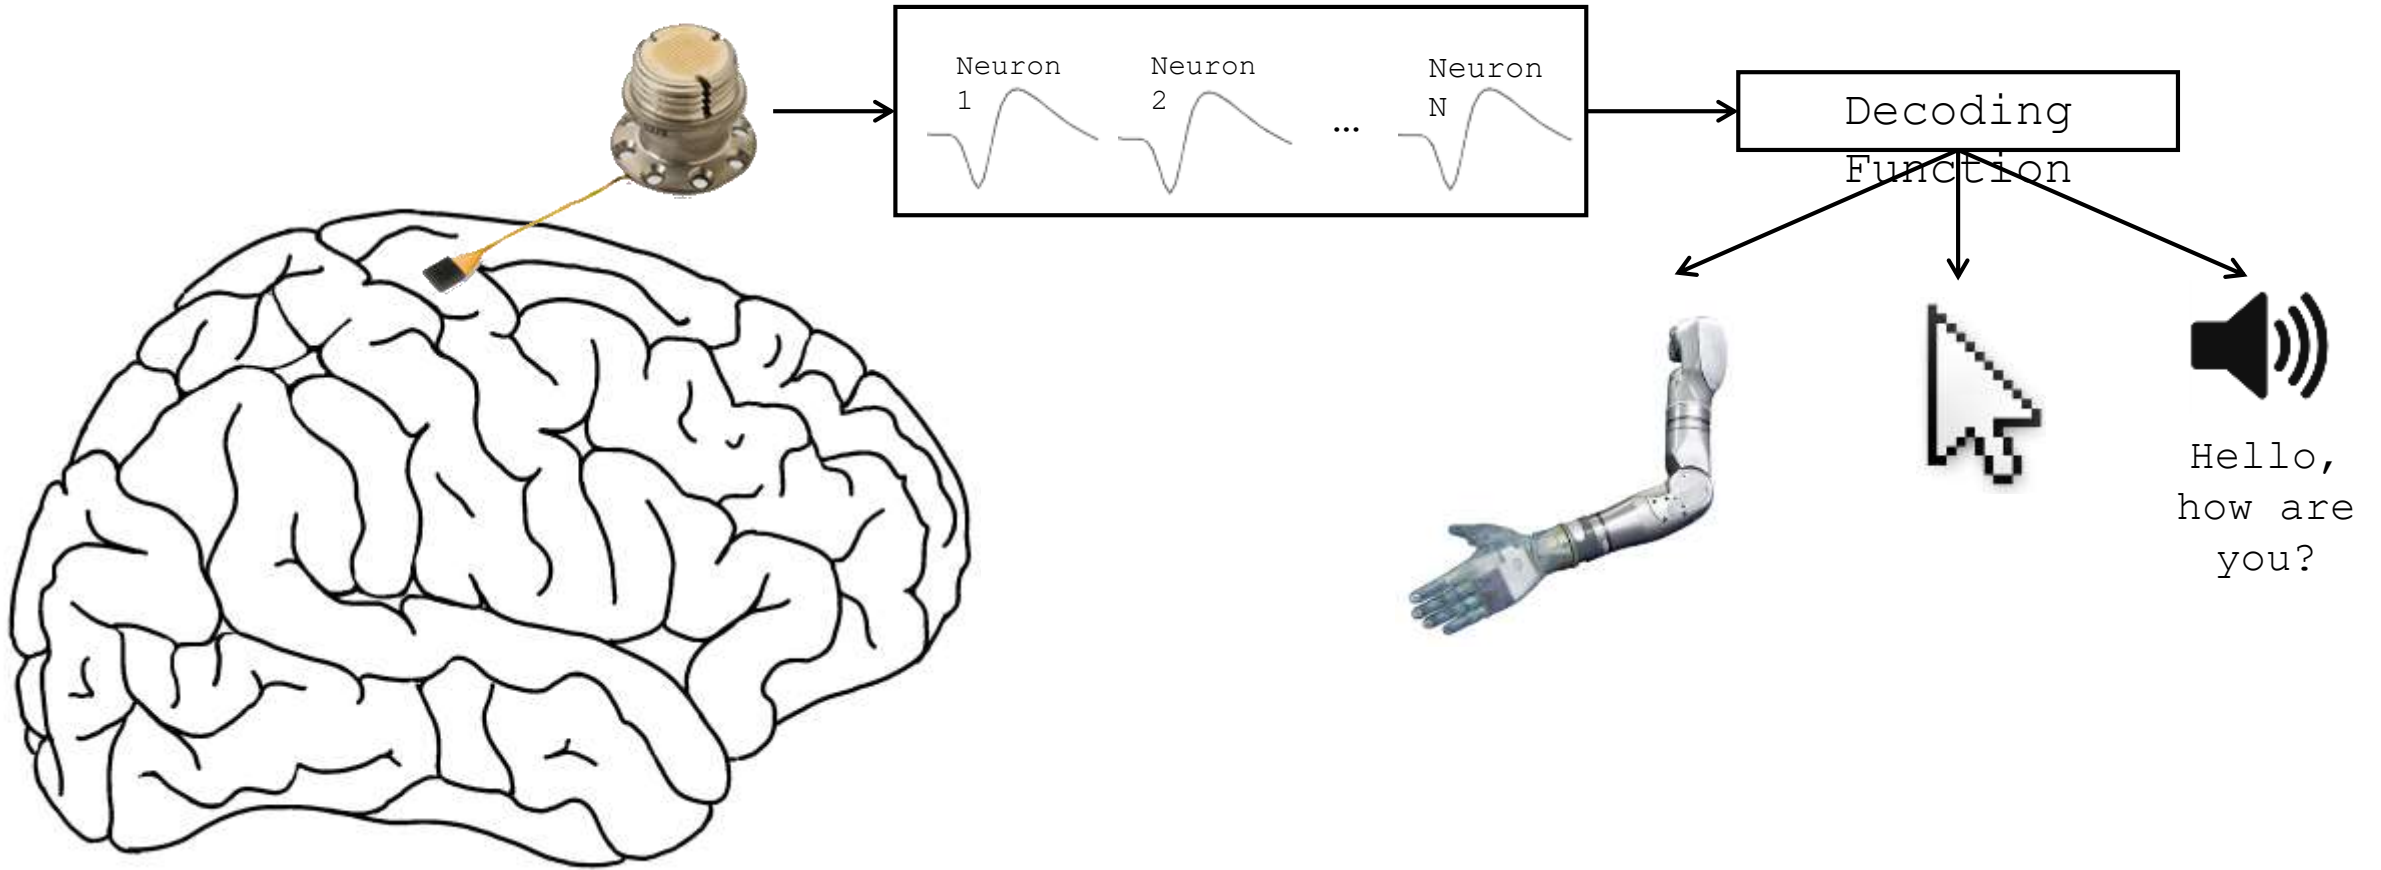

# The Clinical Need

my communication system disqualifies repartee: the keenest rapier grows dull and falls flat when it takes several minutes to thrust it home. ... It deprives conversation of its sparkle, all those gems you bat back and forth like a ball.

-Jean-Dominique Bauby

# Brain-Computer Interfaces

# 8 Years of BCI Progress

# The Beginning: Point-and-Click Typing

BCIs for point-and-click typing have achieved typing rates of **8 words per minute**

Pandarinath et al. 2017

**What does the future hold?**

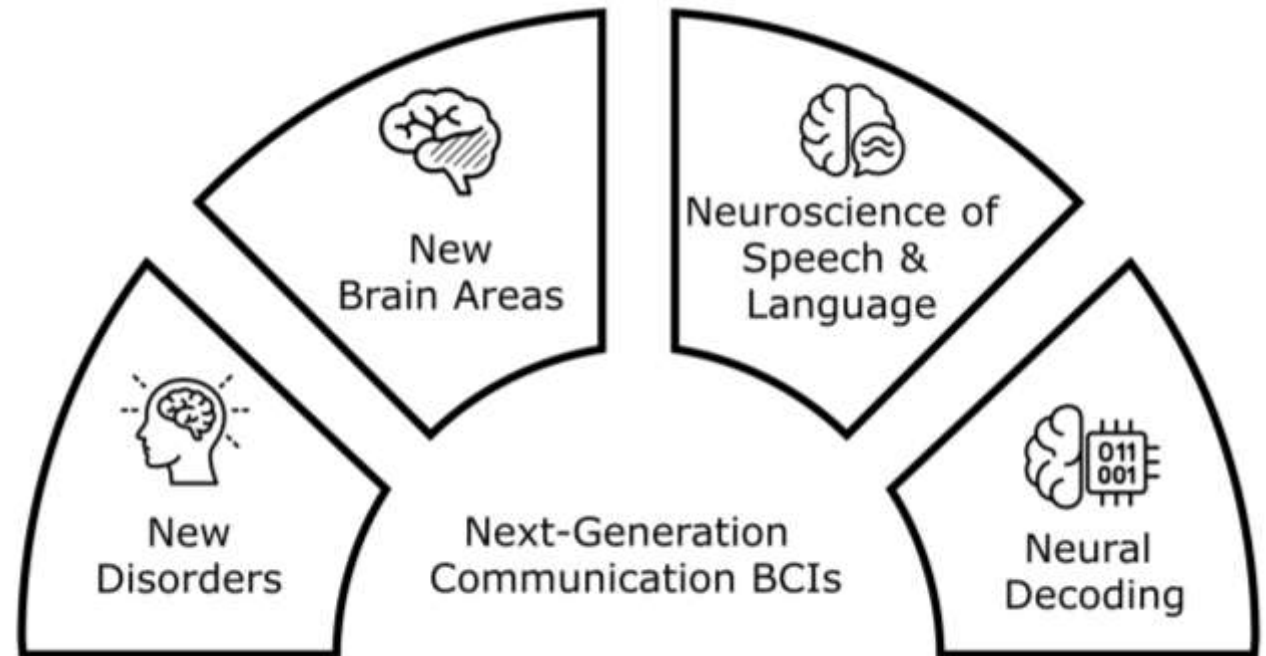

# Translation is Underway

We can expect: Fully implanted, wireless, more electrodes, better longevity

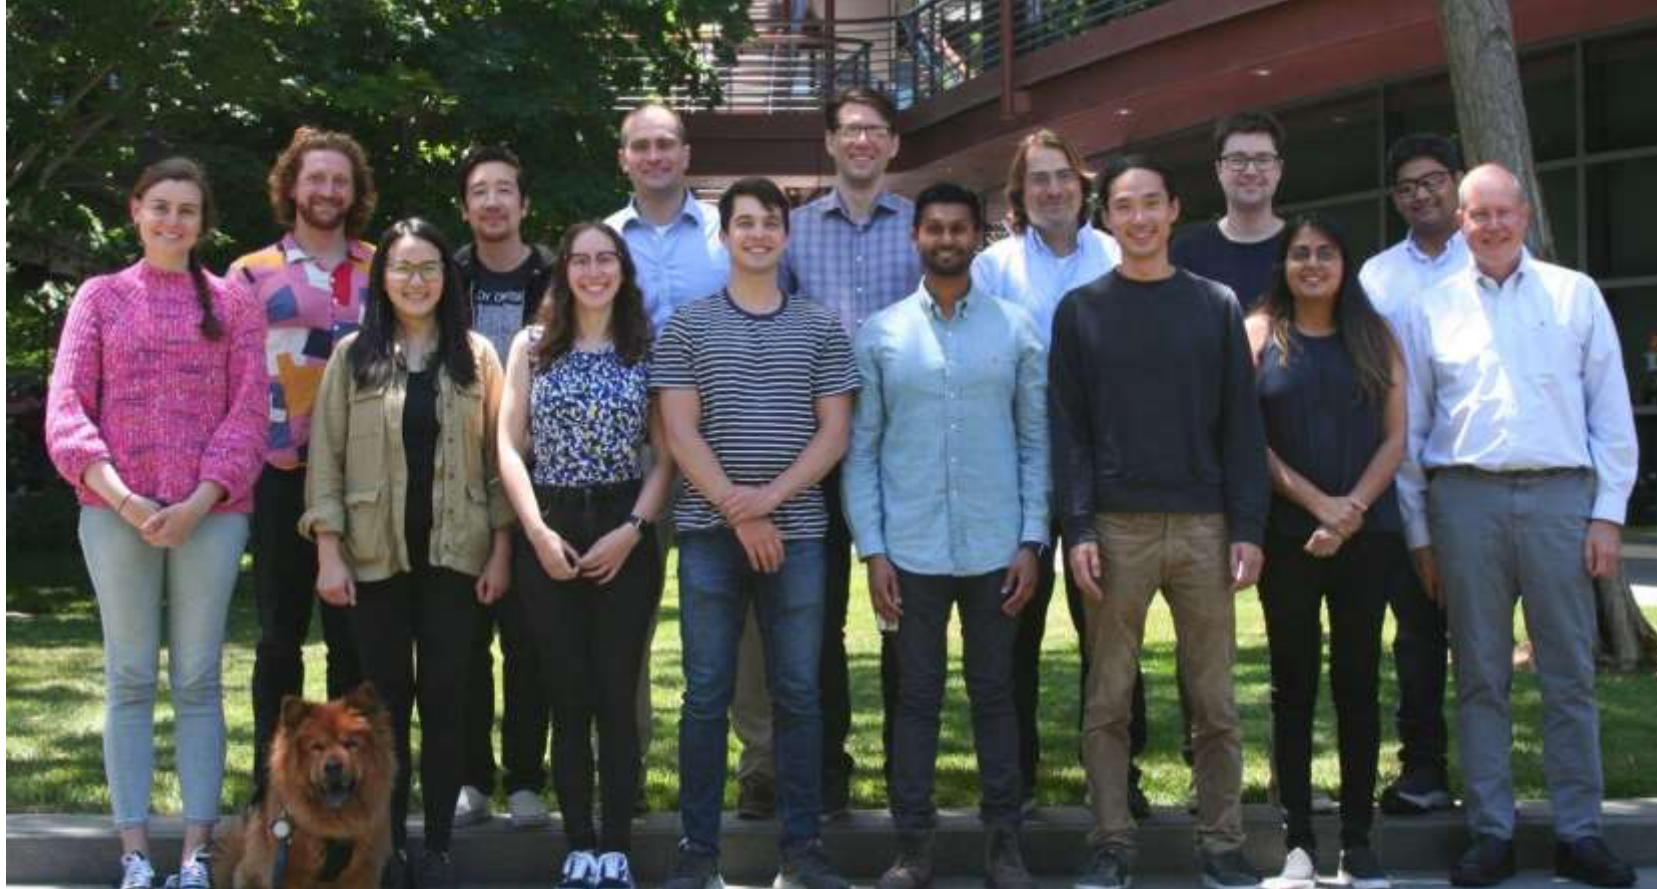

# Future of Communication BCIs

- New disorders beyond ALS & brainstem stroke
  - Cerebral palsy
  - Broca's aphasia caused by stroke
- New brain areas outside of motor cortex
- Understanding the neural representations of language
- Neural decoders that can work with higher-level representations

# Conclusion

- Communication BCIs for ALS and brainstem stroke have progressed from point-and-click to speech
- Inner speech may enable even faster and more comfortable communication
  - Care must be taken to ensure user agency, but this is a solvable engineering problem
- Decades of implantable BCI demonstrations have inspired promising commercial efforts for translation
- Future work will address new disorders with larger populations
